

IN THE CLAIMS

Claim 1 (currently amended): An apparatus for effecting a controlled startup of a processor device; the apparatus comprising:

- (a) a first signal-treating circuit coupled with a voltage supply locus; said first signal-treating circuit receiving a voltage supply signal and producing a first treated signal representing said voltage supply signal;
- (b) a second signal-treating circuit coupled with said voltage supply locus; said second signal-treating circuit receiving said voltage supply signal and producing a second treated signal representing said voltage supply signal; and
- (c) a comparing unit; said comparing unit having a first input locus coupled with said first signal-treating circuit and receiving said first treated signal; said comparing unit having a second input locus coupled with said second signal-treating circuit and receiving said second treated signal; said comparing unit generating an output signal at an output locus when said first treated signal has a predetermined relationship with said second treated signal; said output locus being coupled with said processor device; ~~said output signal effecting said controlled startup~~ said processor device being controlled during startup by said output signal.

Claim 2 (original): An apparatus for effecting a controlled startup of a processor device as recited in Claim 1 wherein said processor device includes a reset control pin; signals applied to said reset control pin controlling a reset operation of said processor device; said output locus being coupled with said reset control pin.

Claim 3 (original): An apparatus for effecting a controlled startup of a processor device as recited in Claim 1 wherein said first treated signal is a time-delayed representation of said voltage supply signal and wherein said second treated signal is a non-delayed representation of said voltage supply signal.

Claim 4(original): An apparatus for effecting a controlled startup of a processor device as recited in Claim 2 wherein said first treated signal is a time-delayed representation of said voltage supply signal and wherein said second treated signal is a non-delayed representation of said voltage supply signal.

Claim 5 (original): An apparatus for effecting a controlled startup of a processor device as recited in Claim 1 wherein said comparing unit is a comparator.

Claim 6 (original): An apparatus for effecting a controlled startup of a processor device as recited in Claim 5 wherein said processor device includes a reset control pin; signals applied to said reset control pin controlling a reset operation of said processor device; said output locus being coupled with said reset control pin.

Claim 7 (original): An apparatus for effecting a controlled startup of a processor device as recited in Claim 5 wherein said first treated signal is a time-delayed representation of said voltage supply signal and wherein said second treated signal is a non-delayed representation of said voltage supply signal.

Claim 8 (original): An apparatus for effecting a controlled startup of a processor device as recited in Claim 6 wherein said first treated signal is a time-delayed representation of said voltage supply signal and wherein said second treated signal is a non-delayed representation of said voltage supply signal.

Claim 9 (currently amended): An apparatus for controlling operation of a processor device during startup of said processor device; the apparatus comprising:

(a) a signal treating circuit receiving a voltage supply signal at a voltage supply locus; said signal treating circuit using said voltage supply signal for generating a first treated signal and a second treated signal; and

(b) an output circuit coupled with said signal treating circuit; said output circuit receiving said first treated signal and said second treated signal and generating a control signal at an output locus based upon a relationship between said first treated signal and said second treated signal; said output locus being coupled with said processor device; said control signal effecting said controlling; said processor device being controlled during startup by said control signal.

Claim 10 (original): An apparatus for controlling operation of a processor device during startup of said processor device as recited in Claim 9 wherein said processor device includes a reset control pin; signals applied to said reset control pin controlling a reset operation of said processor device; said output locus being coupled with said reset control pin.

Claim 11 (original): An apparatus for controlling operation of a processor device during startup of said processor device as recited in Claim 9 wherein said first treated signal is a time-delayed representation of said voltage supply signal and wherein said second treated signal is a non-delayed representation of said voltage supply signal.

Claim 12 (original): An apparatus for controlling operation of a processor device during startup of said processor device as recited in Claim 10 wherein said first treated signal is a time-delayed representation of said voltage supply signal and wherein said second treated signal is a non-delayed representation of said voltage supply signal.

Claim 13 (original): An apparatus for controlling operation of a processor device during startup of said processor device as recited in Claim 9 wherein said output circuit comprises a comparator.

Claim 14 (original): An apparatus for controlling operation of a processor device during startup of said processor device as recited in Claim 13 wherein said processor device includes a reset control pin; signals applied to said reset control pin controlling a reset operation of said processor device; said output locus being coupled with said reset control pin.

Claim 15 (original): An apparatus for controlling operation of a processor device during startup of said processor device as recited in Claim 13 wherein said first treated signal is a time-delayed representation of said voltage supply signal and wherein said second treated signal is a non-delayed representation of said voltage supply signal.

Claim 16 (original): An apparatus for controlling operation of a processor device during startup of said processor device as recited in Claim 14 wherein said first treated signal is a time-delayed representation of said voltage supply signal and wherein said second treated signal is a non-delayed representation of said voltage supply signal.

Claim 17 (currently amended): A method for controlling operation of a processor device during startup of said processor device; the method comprising the steps of:

(a) in no particular order:

- (1) providing a signal treating circuit; and
- (2) providing an output circuit coupled with said signal treating circuit;

- (b) operating said signal treating circuit to receive a voltage supply signal at at least one voltage supply locus;
- (c) operating said signal treating circuit to use said voltage supply signal for generating a first treated signal and a second treated signal;
- (d) operating said output circuit to receive said first treated signal and said second treated signal;
- (e) operating said output circuit to generate a control signal at an output locus; said control signal being based upon a relationship between said first treated signal and said second treated signal; and
- (f) providing said control signal to said processor device for effecting said controlling; controlling said processor device during startup by said control signal.

Claim 18 (original): A method for controlling operation of a processor device during startup of said processor device as recited in Claim 17 wherein said processor device includes a reset control pin; signals applied to said reset control pin controlling a reset operation of said processor device; said output locus being coupled with said reset control pin.

Claim 19 (original): A method for controlling operation of a processor device during startup of said processor device as recited in Claim 18 wherein said output circuit comprises a comparator.

Claim 20 (original): A method for controlling operation of a processor device during startup of said processor device as recited in Claim 19 wherein said first treated signal is a time-delayed representation of said voltage supply signal and wherein said second treated signal is a non-delayed representation of said voltage supply signal.
